Plugins

VSCode has many useful extensions, among which I found **Beautify** to be one of the top. This extension allows you to have your own custom coding style as well as organize your code. I found this to be great for consistency and managing my files whether they are in HTML/CSS or JavaScript. In addition, the **integrated terminal** is helpful so that you can navigate through your folder structure. I had a large directory in which I had to install different modules so being able to navigate and install items easily was important. Another tool I like to use is **Browser Preview**. This extension allows you to view the website you are working on right in VSCode, instead of having to open up a new window. This was convenient for me and saved some time so I would recommend it!

It was great to learn from my peers as well about what extensions they found helpful. ESLint and Jupyter are among my favorites. ESLint helps with maintaining consistent and clean code while Jupyter allows running one section of code instead of the entire program, which saves time. Overall, I will take these suggestions into account and utilize the plugins to aid in my projects.
